RecipeKG agent
GraphDB-backed multi-agent planner

Our services gather your information from the parameters above and build the perfect weekly nutrition plan through the RecipeKG multi-agent pipeline.

The orchestration starts with a medical agent that interprets allergies, diseases, blood type, goal, and activity level as hard constraints. A food scientist agent then queries our GraphDB recipe knowledge graph for safe candidate meals. The nutrition planner estimates servings, balances macros across the week, and composes a structured plan with meals, ingredients, rationale, and nutrition totals.

This makes the RecipeKG run traceable: every generated plan is based on profile constraints, graph-backed recipe candidates, and macro calculations instead of a direct free-form prompt.

Nutrition plan is available.

Day 1

Balances high protein needs with complex carbs while keeping total sugar at approximately 41g.

Day 2

Focuses on rice-based gluten-free carbohydrates to hit the 280g+ carb target while staying under the 350g cap.

Day 3

Uses diverse meat and bean combinations to maximize caloric intake while maintaining strict blood sugar control.

Day 4

Prioritizes fats and proteins from varied sources to meet caloric needs while keeping sugars under 43g.

Day 5

Achieves over 3100 kcal through a mix of seafood and pork while staying below the 50g sugar limit.

Day 4

Prioritizes fats and proteins from varied sources to meet caloric needs while keeping sugars under 43g.

Day 5

Achieves over 3100 kcal through a mix of seafood and pork while staying below the 50g sugar limit.

Day 6

Features recipes with very low sugar counts to offset the sugar in the day's rice portions.

Day 7

Final day ensures cumulative variety while maintaining the 3100 kcal target through calorie-dense chilies and sausages.

2 serving

Generated Gemini plan

This plan provides approximately 3,100 calories daily to support muscle gain for a 183cm male. It is strictly gluten-free and dairy-free. To manage blood sugar, it prioritizes low-glycemic complex carbohydrates (quinoa, sweet potatoes, brown rice) and high fiber, while keeping added sugars near zero.

Status:

Hypertrophy focus; Active caloric surplus

SODIUM
12365 mg

Day 1

High protein count to support muscle gain for a moderately active male, keeping sugar low to manage blood glucose.

Day 2

Strong focus on protein and omega-3s for inflammation control and muscle growth.

Day 3

Lower sodium day with high volume protein sources.

Day 4

Maintains gluten-free and dairy-free standards while focusing on satiety.

Day 3

Lower sodium day with high volume protein sources.

Day 4

Maintains gluten-free and dairy-free standards while focusing on satiety.

Day 5

Caloric intake balanced with complex carb sources to manage blood sugar.

Day 6

High fat/protein day to support hormone production and muscle repair.

Day 7

Concluding the week with varied protein sources and controlled sugar.

serving

Vietnamese Crispy Carrot and Cabbage Salad with Sliced Chicken and Chile-Lime Marinade

Chicken salad with mint and lime provides a light, high-protein breakfast.

Ingredients

1/4 cup Thai basil
1 1/2 boneless skinless chicken breasts
4 cups cabbage
3 cups carrots
3/4 cup cilantro
1/4 teaspoon crushed red pepper flakes
1/4 cup dry roasted salted peanuts
5 tablespoons fish sauce
7 tablespoons fresh lime juice
1/2 cup fresh mint leaves
2 cloves garlic cloves
peanut oil
1/2 red onion
6 tablespoons rice vinegar
salt
2 scallions
2 serrano chilies
2 shallots
3 tablespoons sugar
1 teaspoon wasabi

Red Beans and Rice

Red beans and rice with sausage for high fat and calories.

Ingredients

1 tablespoon Old Bay Seasoning
1 lb andouille sausages
3 bay leaves
1/2-1 teaspoon cayenne pepper
1 teaspoon celery seeds
cooked rice
2 lbs dried red kidney beans
1/2-1 teaspoon dry crushed red pepper
1 cup dry red wine
1 teaspoon fresh ground black pepper
1 tablespoon fresh oregano
1/2 cup fresh parsley
4 garlic cloves
1 green bell pepper
1 tablespoon gumbo file
1 teaspoon hot sauce
2 onions
1 teaspoon paprika
1 red bell pepper
1 teaspoon salt
1/2 lb salt pork
1 lb smoked beef sausage

3/2 ounces diced tomatoes
1/2 head garlic
2 jalapenos
2 onions
3/2 ounces pinto beans
2 lbs pork
2 teaspoons sea salt
4/6 ounces tomato juice
3/0 ounces tomato sauce
1 lb turkey
2 teaspoons vegetable oil
3 lbs venison
3/0 ounces whole tomatoes

}  
}
```

Rules:

1. Return exactly 7 days.
2. Each day should have breakfast, lunch, and dinner. Add snacks only when useful.
3. Respect allergies and diseases/conditions strictly.
4. If the user has diabetes or sugar restriction, keep sugar conservative.
5. If the user has hypertension or sodium restriction, keep sodium conservative.
6. Macros must be realistic estimates for the listed servings.
7. Compute day totalMacros as the sum of meal totalMacros.
8. Compute weeklyTotals as the sum of day totalMacros.
9. Do not include markdown fences or explanation outside JSON.

USER_PROFILE:

Age: 21

Create Account	

каде внесува сопствени телесни параметри, како и болести, алергии...

- Потоа се испраќа повик до медицинско лице агент кој изгледа:

You are an expert Clinical Dietitian and Medical AI Agent.

Your task is to analyze the user's biological profile and generate a STRICT JSON manifest of dietary constraints.

CRITICAL RULES FOR TERMINOLOGY & STATUS:

1. STATUS DETERMINATION:

- If 'Allergies' is "None" AND 'Diseases/Conditions' is "None", you MUST set "status": "UNCONSTRAINED".

- ONLY set "status": "CONSTRAINED" if the user has a specific allergy, disease, or clinical condition requiring strict filtering.

2. 'hard_exclusions':

Your job is to act as a Keyword Unroller. You must translate the user's dietary restrictions into a flat JSON array of singular, root ingredient keywords and common foods that contain them.

- Do NOT use broad ontology categories. Unroll them into specific, high-risk ingredients.

- Strip pluralization (e.g., use "peanut" not "peanuts").

EXAMPLES:

- User: "I have a fish allergy." -> Output: ["fish", "salmon", "tuna", "cod", "trout"]

- User: "I have a dairy allergy" -> Output: ["milk", "cheese", "butter", "whey"]

- Uer: "I have a gluten allergy" -> Output: ["wheat", "bread", "flour", "pasta", "crouton", "pretzel"]

3. 'nutrient_caps' RULES:

- Each entry must contain exactly one USDA nutrient name.

- Do NOT combine nutrients (no commas, no "and", no grouping).

- Do NOT repeat the same nutrient more than once.

- Use canonical USDA names only (examples: "Carbs", "Sugar", "Sodium", "Energy", "Protein", "Fat").

4. IF UNCONSTRAINED:

Leave the 'hard_exclusions', 'nutrient_caps', and 'required_boosts' arrays completely EMPTY.

USER PROFILE:

Age: 21

Gender: Male

Height (cm): 183.0

Weight (kg): 75.0

Blood Type: B+

Activity Level: Moderate

Goal: Gain muscle

Allergies: [Gluten, Dairy]

Diseases/Conditions: [High blood sugar]

EXPECTED JSON SCHEMA:

```
{
  "status": "CONSTRAINED",
  "constraints": {
    "hard_exclusions": ["<String>"],
    "nutrient_caps": [
      { "nutrient": "<String>", "max_value": <Number>, "unit": "<String>" }
    ]
  },
  "medical_rationale": "<String detailing the clinical reasoning>"
}
```

- Додека одговорот е:

```
{
  "status": "CONSTRAINED",
  "constraints": {
    "hard_exclusions": [
      "wheat",
      "bread",
      "flour",
      "pasta",
      "crouton",
      "pretzel",
      "barley",
      "rye",
      "semolina",
      "couscous",
      "bulgur",
      "milk",
      "cheese",
      "butter",
      "cream",
      "yogurt",
      "whey",
      "casein"
    ],
    "nutrient_caps": [
```

```

    {
      "nutrient": "Sugar",
      "max_value": 45,
      "unit": "g"
    },
    {
      "nutrient": "Carbs",
      "max_value": 350,
      "unit": "g"
    }
  ]
},
"medical_rationale": "The user has gluten and dairy allergies, so common
gluten-containing grains and dairy-derived ingredients are excluded. High blood
sugar requires limiting sugar and moderating total carbohydrate intake while still
supporting the user's muscle-gain goal."
}

```

- Потоа се испраќа повик до „Performance“ агентот, во кој се содржат податоците за корисникот, како и генерираниот „медицински манифест“. Неговата цел е да одреди граници за внес на нутритивни вредности врз база на целта на корисникот, како и препораките од медицинскиот агент.
- Пример на prompt:

You are a sports nutrition performance agent.

Calculate performance nutrition targets for this user and return STRICT JSON only. These targets are performance-based, not medical hard constraints. Use the user's goal, body metrics, and activity level to estimate daily calories, protein, carbs, and fat. Then derive per-serving targets suitable for ranking individual recipes. Respect the medical manifest when choosing reasonable upper/lower ranges, but do not duplicate medical hard exclusions.

Return exactly this shape:

```
{
  "goalStatus": "HYPERTROPHY|FAT_LOSS|MAINTENANCE|ENDURANCE",
  "dailyTargets": [
    {"nutrient": "calories", "min": 0, "target": 0, "max": 0, "unit": "kcal", "period": "day"},

- Потоа податоците за корисникот, „медицинскиот манифест“, „performance manifest“ и рецептите се испраќаат до агентот нутриционист. Процесот се одвива во три чекори, каде во секој чекор се испраќаат по 30 рецепти (сумаризирани), како и меморијата од претходниот чекор.
- Пример за барање и одговор во вториот чекор:

Барање (prompt):

You are a nutritionist recipe scout. Maintain a rolling shortlist; do not build the 7-day plan yet.

Rules: use only IDs in CURRENT_SHORTLIST or NEW_BATCH; max 24 selected IDs; respect medical caps/exclusions; prefer goal fit, variety, usable macros, and meal-slot coverage. Keep 5-7 breakfast-suitable recipes when available. Judge breakfast suitability from label, ingredients, preparation style, and practical context. Do not choose breakfast coverage only by macro density. USDA macros are estimates; note implausible values or important unresolved ingredients.

```

RULES:

1. Exactly 7 days; 3-5 meals/day; include breakfast/lunch/dinner daily.
2. Breakfast: choose recipes you judge breakfast-suitable from label, ingredients, preparation style, and context when available. Do not choose breakfast solely for macro density.
3. Medical constraints are mandatory.
4. Servings allowed: 0.5, 1.0, 1.5, 2.0.
5. Max 2 uses per recipe ID/week; count before answering.
6. Add snack/dessert only when useful.
7. Output recipe IDs only, not full recipe objects.

OUTPUT_SCHEMA:

```

{
  "goalStatus": "string",
  "summary": "string",
  "days": [
    {
      "day": 1,
      "meals": [
        {
          "slot": "breakfast|lunch|dinner|snack|dessert",
          "recipeId": "R1",
          "servings": 1.0,
          "reason": "short practical reason"
        }
      ],
      "dayRationale": "short rationale"
    }
  ]
}

```

```
]
}
```

TASK:

Build the final 7-day plan. Use at least 18 unique recipe IDs when 18+ are available, otherwise use as many distinct IDs as practical. Use fewer only for medical constraints. Count recipe usage before answering; max 2 uses per recipe/week.

- И одговор (скратен на еден ден само):

```
{

TASK:

Repair the plan with minimal changes. Priority: medical caps, breakfast/lunch/dinner present, breakfast appropriateness by your judgment, calorie/protein minimums, repetition/variety. Use NUMERIC_REPAIR_GUIDANCE exactly. Keep passing days unchanged unless needed for global repetition. Max 2 uses per recipe/week. Prefer 18-24 unique IDs when enough candidates exist. Return the complete corrected 7-day plan, not a patch.

- Одговор:

```

{

- Доколку планот е поправен или пак доколку лимитот на итерации за поправка на планот е достигнат, се испраќа планот до корисникот.

3. Краток заклучок:

Поради ограничени ресурси и грешки во мапирањето на рецептите во базата, може да се заклучи дека директниот повик до Gemini резултираше со несоодветни планови. Исто така може да се примети дека честопати рецептите за појадок не се соодветни. Ова пробавме да го решиме преку посебен прашалник до база каде ќе се пребаруваат рецепти кои содржат имиња на состојки соодветни за појадок, како и преку построги наредби во prompt-от на агентите, но сепак не добивме несоодветни предлози.
